Research Paper Topic

For this final project research paper, I think it would be best for the whole class to write about their respective majors. For most people, their major is something that they have been looking into for quite some time already; in my case, computer science. From when I was young I always enjoyed electronic devices, whether it be my toddler self “examining” my father’s VCR, when I take apart my laptop to clean the components, or even when I look into the pages of web development for fun. Since computer science is such a vast field, getting into something that is enjoyable and profitable isn’t that difficult for many individuals. Google calls computer science “the study of both computer hardware and software design. It encompasses both the study of theoretical algorithms and the practical problems involved in implementing them through computer hardware and software.” This field is commonly known as a “love it or hate it” situation. Having had some background from high school, I developed a further interest in this field. After learning about everything that you could create with knowledge in this field. I would like to continue to find out what you can do with a degree in computer science, and its history.

Most of the articles given hardly did anything to waver my stance. Once I heard that we could choose any topic, I immediately thought of writing about computer science. My last paper for my english class last year was supposed to be about this same topic, but it had been put off because I had to write a graduation speech instead.
